# Who are we?

Serving the HVAC&R industry through cutting edge research, state-of-the-art software, and performance measurement and verification of new technologies that can reduce energy consumption and address growing environmental concerns.

Defend and grow markets for copper based on its superior technical performance and its contribution to a higher quality of life worldwide. Members include copper mining and fabricating companies.

For over 70 years, providing machines, tools, and expertise to the heat transfer and tube processing industries.

Providing heat exchanger design, prototyping and manufacturing assistance for the HVAC&R industry with a focus on materials, joining methods, and novel designs.

# Introduction

# Round Tube Plate Fin (RTPF) Coils

- Why do we use RTPF for HVAC applications?
  - Established technology
  - Good water shedding properties
  - Customizable fin, tube, and coil geometry

# RTPF Anatomy

# RTPF Flexibility

## Tubes & Return Bends

# Roll & Weld

## Embossing Process

- Eliminates constraints on surfaces
- Mature technology (wet and dry)
- Speed independent
- Closed loop control of Key Variables

## GTAW Process

- Gas tungsten arc welding
- In-line induction annealer
- Eddy Current Testing
- In line finish packaging

## High Frequency Process

- Precision control of weld parameters
- Forged / resistance weld
- Reduction to small diameters
- High Speed Production
- Close tolerances held

# Cast & Roll

CONTINUOUS CASTING

Utilizes high rotary forces and dynamic recrystallization to generate large reductions and a fine grain structure

EXTRUSION

Traditional drawing to small diameters and light wall thickness

## Lacing

# Lacing

# Coil Manufacturing

## Expansion

# Expansion

Create a rigid coil from loose raw material

After

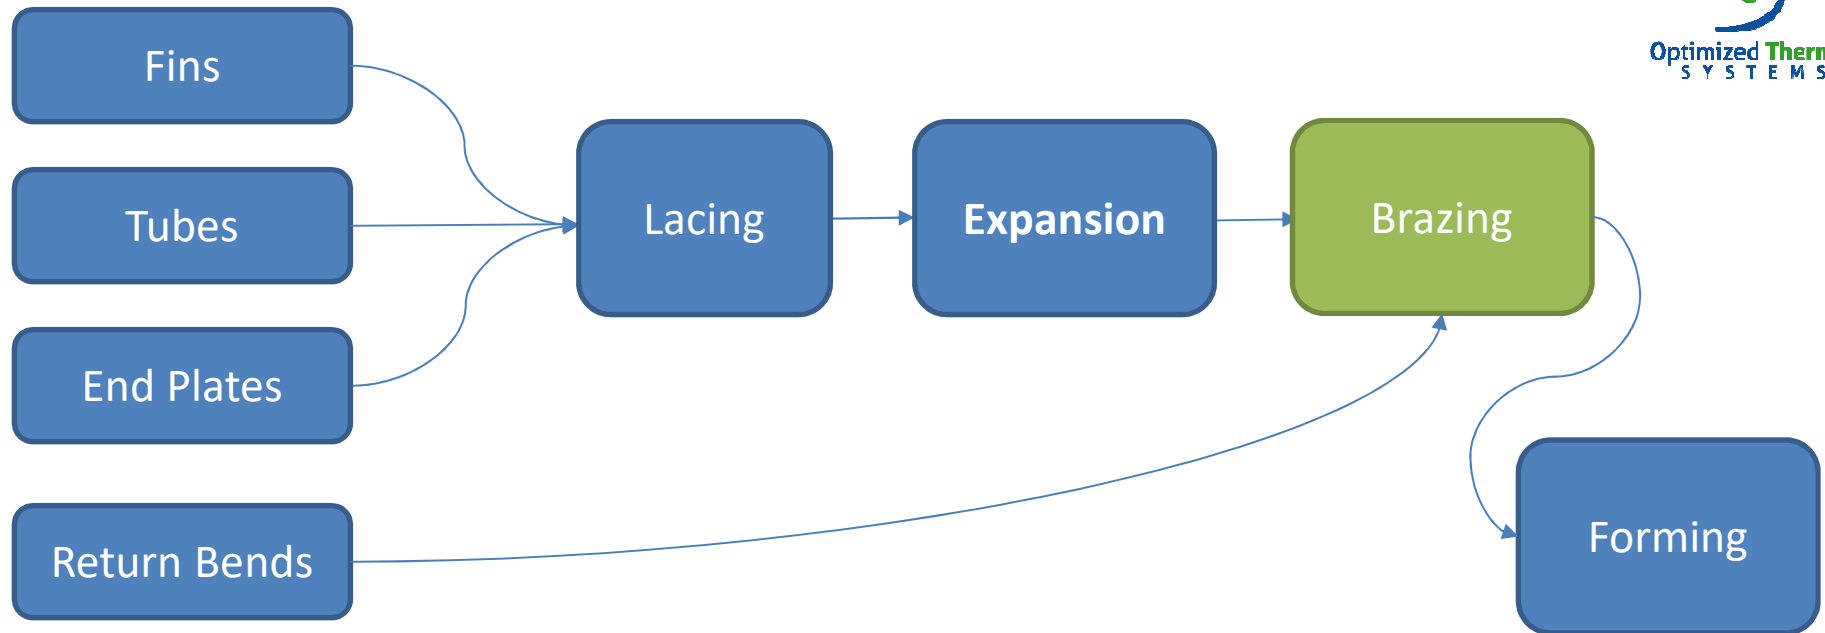

# Expansion

- Establishes the contact between tube and fin to conduct heat
- Interference =  
Expanded Tube OD – Fin Collar ID
- Min interference must be maintained to account for thermal expansion of dissimilar materials
- Industry standard - .004"
- Material & Tooling Tolerance Factors  
(Mechanical Expansion Only)
  - Min Developed Interference - .0005"
  - Max Developed Interference - .0075"

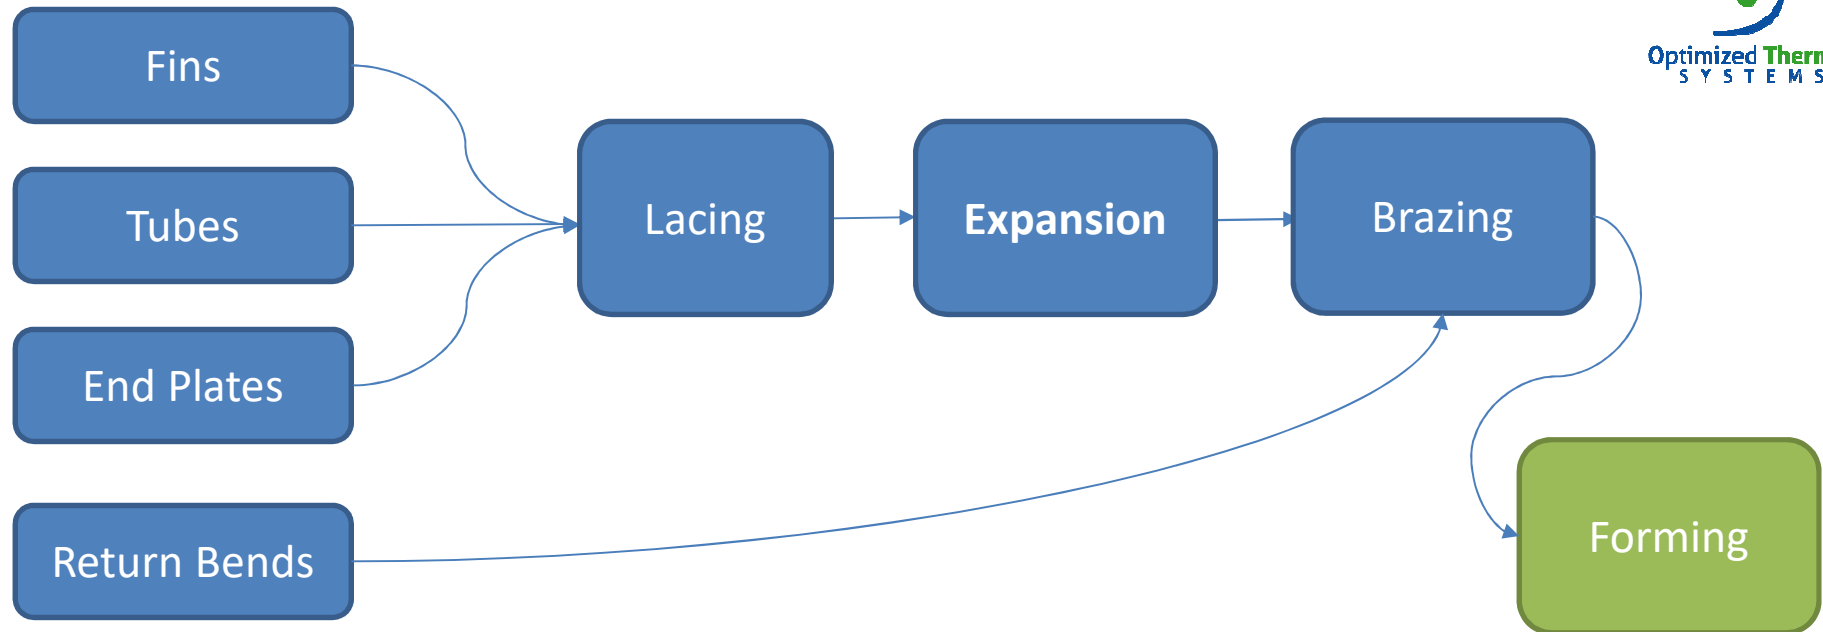

# Coil Manufacturing

## Brazing

# Brazing

# Coil Manufacturing

## Forming

# Forming

- Forms expanded coil into shapes for installation into unit (i.e. “L”, “U”, “D”)
- Single or multi-row composite capability
- Forming parallel or perpendicular to tubes

# Historical Trends

# Historical Trends

## Areas of Change

- Pattern & Tube Geometry
  - Smaller Tube Diameter → Denser Tube Patterns
  - Reduction in Tube Wall Thickness
- Fin Design & Material
  - Reduction in Fin Thickness
  - Alternate Fin Alloys

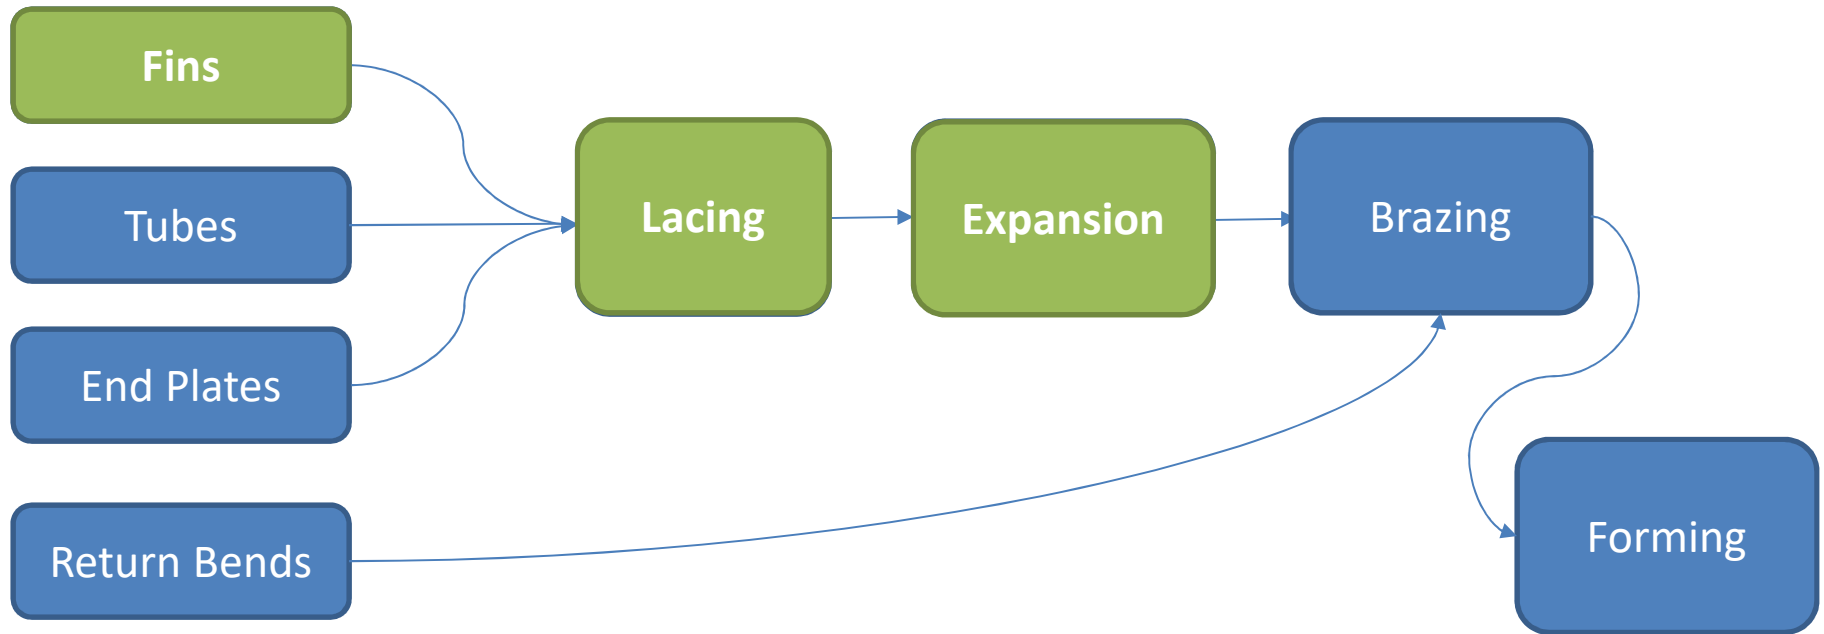

## Driving Factors

- Higher efficiency systems
- Refrigerant changes
- Material & Labor Costs

# Manufacturing Considerations

For Small Diameter Coils

# Considerations With Small Diameter Coils

# Fin Production Considerations

- Smaller, denser fin patterns
- Fin stacking

3/8"

5mm

# Lacing Considerations

- More tubes, more time for manual labor
  - Raw material saving easily outweigh labor costs
- Challenges in inserting tubes – potential buckling/sagging

# Expansion Considerations

As tube diameter decreases

the tube's **hoop strength** increases to resist the expansion force of the bullet

And the tube's **column strength** decreases to resist buckling of the tube

# Bell and Flare Considerations

# Bell and Flare Considerations, Cont'd.

Too Short = No Flare

Too Long = Splits

Peg Leg = Splits & No Flare

# Manufacturing Solutions

# Fin Handling – Stacking Improvements

- Heavy-Duty Stacking Unit
- Improved Stacker Rods
  - Stainless Steel Rod Material
  - Tip geometry

Original  
Design

Improved  
Design

# Lacing Solutions

- Operator Training
- Better Hairpins

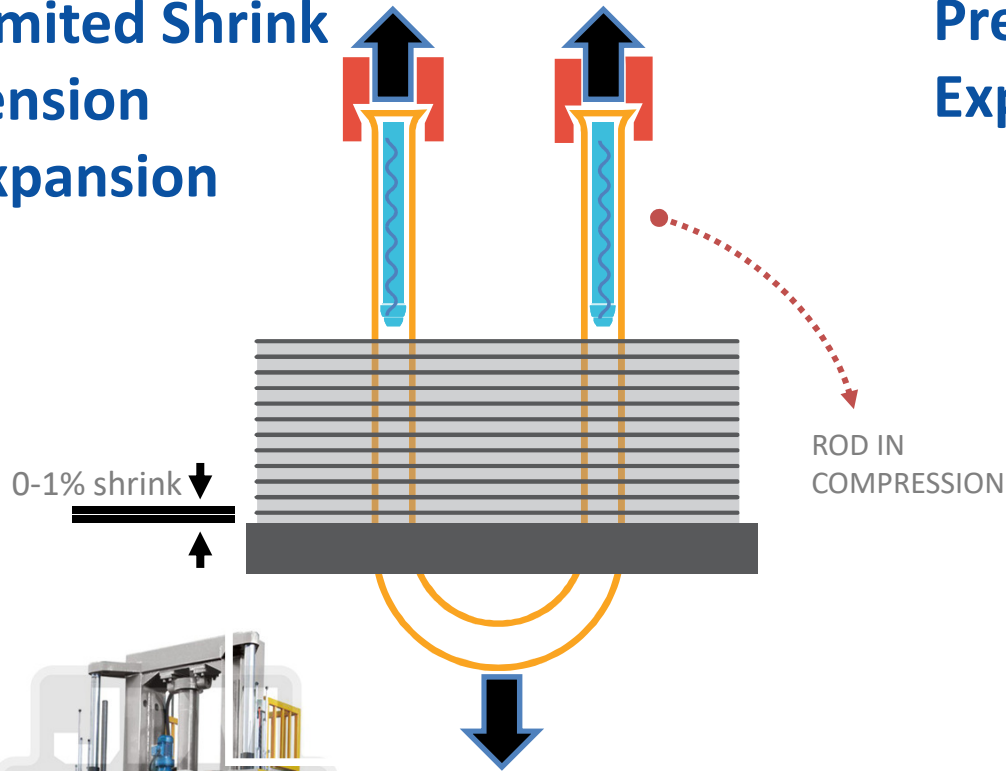

- Automation
  - Tube insertion
  - Laced coil transfer to expander

# Expansion Solutions

## Limited Shrink Tension Expansion

## Pressure Expansion

# Bell and Flare Solutions

- 2-Stage Bell and Flare
  - Peg Leg Control
  - Precise Bell & Flare dimension
  - No Splits in Bell & Flare

# The Effects of Using Small Diameter Tubes

---

- Higher hoop strength
  - Withstand higher operating pressures
  - Need for alternate expansion method
- Reduced wall thickness
  - Reduce material consumption – cost savings!
  - Reduced column strength – need for controlled lacing and expansion
- Greater fin complexity
  - Both design and density
  - Improved stacking processes

# Market Potential

- 134 million Aircon units made in 2011
- 268 million RTPF HXs → 8 HXs / second!
- 25% use small diameter copper tube HXs → 2 HXs / second!

**Millions of small diameter coils are produced each year across the world.**

**It's EASY – with the RIGHT tools and procedures!**
